

Outdoor Antenna Bundle Sample Installation

External Antenna (CM288W)

The external antenna is placed outside the building, where the signal strength is the strongest. For optimal performance it should be placed on the roof, but it can also be installed on the building's awning or outside a window.

20-foot Coax Cable (CM004-20-FN)

A 20-foot Ultra Low Loss Cable is included with this bundle to connect the outdoor antenna to your USB AirCard.

Wilson Signal Amplifier (Optional) (811200)

You have the option of selecting an amplifier to further increase your data speeds. The amplifier is the only part of the kit which requires power. It should be placed next to the data card. We recommend the Wilson Direct Connect Amplifier with AC Power Supply (part number 811200).

Adapter Cable (part number varies)

A short adapter cable is included to attach the coax cable to your data card. It is a special cable designed specifically for your data card's external antenna port. The external antenna port on the data card is usually easy to find, often covered with a small piece of plastic.
